

Written Reflection:

This browser extension that I created is built using Manifest V3. It aims to solve the problem of information fragmentation. It's just an interactive tool that can be used to put together scattered data by letting users take customizable notes that are explicitly mapped to all the particular website URLs. As it is developed in the context of Manifest V3 standards, this extension applies fully event-driven CRUD operations by saving the text, its format, and color arrays inside (`chrome.storage.local`). This tech-based extension involves the use of the (`chrome.tabs`) API for its architecture to capture the metadata; this extension also is capable to real time tracking the number of characters in the text written, and it uses (`chrome.runtime`) message handling to update the event counters. During the development of this assignment project, my understanding of how to connect the content with the browser, how to use APIs, and how the browser components work in an isolated context, yet maintaining seamless communication through messaging in the background channels, to add to the browser's functionality.
